## WS 封装使用文档

## Web Service 端:(开启方式)

用 Intellij 打开 project, 运行 deploy.ServiceDeploy.java, 即开启服务。

(部署在 http://localhost:2333/CognitiveService 与 http://localhost:2333/WeatherService 上)

## 调用方式(服务器调用 Web Service)

- 1. 服务介绍
  - a) cognitiveService:
    - i. depictPicture(String filename):返回一个 Description 对象;(具体类内容查看包内代码)
    - ii. adultJudge(String filename):返回 Adult 对象;(同上)
  - b) weatherService:
    - i. showWeather(double lat, double lon): 返回 WeatherData 对象。(同上)
- 2. 调用方法:

需要引入两个服务的接口(<u>CognitiveService.java</u>; <u>WeatherService.java</u>) 与返回类的 java 文件(<u>Description.java</u>; <u>Caption.java</u>; <u>Adult.java</u>; <u>WeatherData.java</u>) ;

参考学长教程与 client.Client.java 中的代码。(如下)

```
//获取服务
URL wsdlUrl = new URL("http://localhost:2333/CognitiveService?wsdl");
QName qName = new QName("http://microsoft/", "CognitiveImplService");
Service service = Service.create(wsdlUrl, qName);
CognitiveService cognitiveService = service.getPort(CognitiveService.class);

System.out.println(cognitiveService.depictPicture("x1.jpg").getCaptions()[0].getText());
System.out.println(cognitiveService.adultJudge("x1.jpg").getIsAdultContent());

//获取服务
URL wsdlUrl1 = new URL("http://localhost:2333/WeatherService?wsdl");
QName qName1 = new QName("http://moji/", "WeatherImplService");
Service service1 = Service.create(wsdlUrl1, qName1);
WeatherService weatherService = service1.getPort(WeatherService.class);

System.out.println(weatherService.showWeather(39.91488908,116.40387397));
```
